Abstrak

Sabuk konveyor adalah alat pemindah bahan dari satu lokasi ke lokasi lainnya. Material batu bara adalah salah satu contoh material berbentuk bulk yang dapat diangkut dengan sabuk konveyor dalam proses menjaga stabilnya ketersediaan pasokan batu bara untuk Boiler sebagai bahan bakarnya. Berdasarkan data lapangan saat ini, jalur sabuk konveyor pada PLTU Paiton unit 9 hanya memiliki satu jalur sehingga dibutuhkan penambahan jalur konveyor sebagai alat redundansi. Tujuan dari studi ini adalah untuk mengetahui spesifikasi dari komponen penambahan sabuk konveyor 1B – 2B PLTU Paiton Unit 9. Oleh karena itu, perlu diketahui kecepatan dan lebar pada sabuk konveyor 1B – 2B. Sehingga dapat menentukan nilai kapasitas dan besar daya sabuk yang digunakan pada sabuk konveyor 1B – 2B. Untuk metode penyelesaian masalah berupa perhitungan ulang dari jalur konveyor yang telah ada, studi literatur tentang perhitungan kapasitas dan daya motor pada sabuk konveyor, pengumpulan data desain dan aktual sabuk konveyor 1B – 2B, wawancara dan diskusi dengan pihak-pihak yang sudah bekompeten. Setelah dilakukan perhitungan terhadap spesifikasi sabuk konveyor pada jalur 1B – 2B di dapatkan kapasitas sabuk (1.500 ton/sekon), lebar sabuk (1400 mm), kecepatan sabuk (2,5 m/s) untuk sabuk konveyor 1B – 2B sesuai dengan rekomendasi spesifikasi sabuk konveyor jalur 1A-2A sehingga dapat menjadi alat redundansi di PLTU Paiton Unit 9.

Kata kunci : sabuk, kecepatan, lebar, kapasitas, motor

Abstract

The conveyor belt is moving material from one location to another. Material of coal is one example of the material shaped bulk that can be transported by conveyor belts in the process of maintaining the relative availability of supply of coal to the Boiler as its fuel. Based on the data field of the current line, conveyor belt on PLTU Paiton unit 9 has only one path so that required the addition of conveyor lines as a means of redundancies. The purpose of this study is to know the specifications of the components of the conveyor belt adding 1B – 2B PLTU Paiton Unit 9. Therefore, please note the speed and width of conveyor belt 1B – 2B. So that it can determine the value of the capacity and large power belt conveyor belts used in the 1B – 2B. For methods of solving problems in the form of calculation of conveyor lines, study of literature on the calculation of the capacity and power of the motor on belt conveyor design and data collection, the actual conveyor belt 1B – 2B, interviews and discussion with parties who have been bekompeten. After the calculation is performed against specification belt conveyor on line 1B – 2B in the get capacity belt (1,500 ton/seconds), the width of the belt (1400 mm), speed of the belt (2.5 m/s) for conveyor belt 1B 2B – in accordance with the recommendation of the conveyor belt specifications line 1A-2A can be a tool for redundancies in the Paiton PLTU Unit 9.

Keywords : belt, speed, width, capacity, power

I. PENDAHULUAN

Latar Belakang

PLTU Paiton Unit 9 menggunakan batubara tipe *lignite* sebagai sumber energi yang berasal dari tambang batubara di Sumatera dan Kalimantan. Batubara *lignite* merupakan batubara dengan *grade low rank* yang memiliki nilai kalori 6300 BTU/lb – 8300 BTU/lb sehingga cocok untuk digunakan industri pembangkit listrik. Batubara yang dikirim dari tambang untuk PLTU Paiton Unit 9 berkisar 12000 DWT batubara. Namun jadwal pengiriman dan kapasitas kapal fluktuatif tergantung batubara di *coal storage*.

Berdasarkan data lapangan, PLTU Paiton Unit 9 memiliki konsumsi batubara untuk sumber energi sebesar 376,3 t/h [1]. Besarnya konsumsi batubara pada PLTU Paiton Unit 9 didukung dengan 2 *Coal Storage*, yaitu *dead storage* dengan kapasitas 24.9×10^4 Ton dan *life storage* yaitu penyimpanan batubara satu unit untuk 30 hari dengan kapasitas 7.7×10^4 Ton [1]. Sehingga total

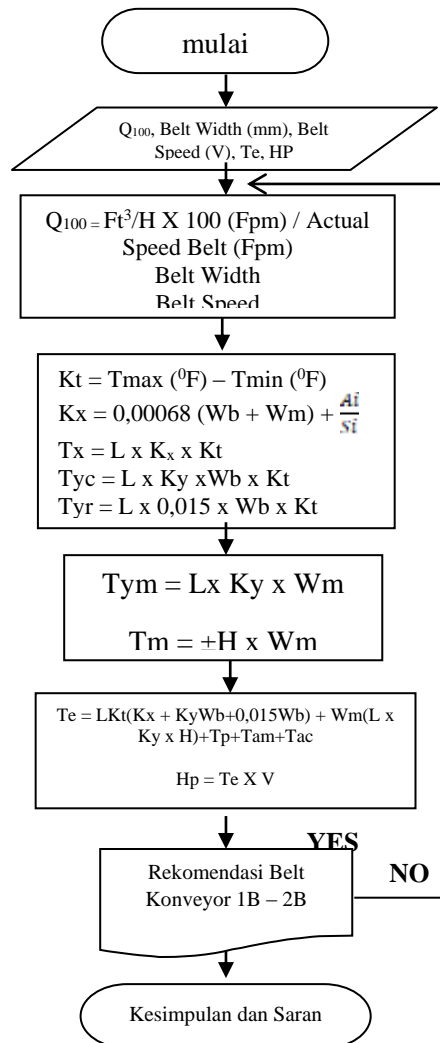

kapasitas *Coal Storage* sebesar 34.6×10^4 Ton. Untuk memenuhi kebutuhan stok batubara, PLTU Paiton Unit 9 menambah satu unit *ship unloader* untuk mempercepat bongkar muat batubara. Grab pada setiap unit *ship unloader* mampu *digging* sebesar 1250 t/h. Penambahan *ship unloader* dimaksudkan untuk mempercepat bongkar muat batubara. Namun hanya terdapat satu *line belt* konveyor dari *ship unloader* menuju *coal storage* yaitu belt konveyor 1A – 2A yang memiliki kapasitas rata-rata 1500 t/h dengan lebar sabuk 1400 mm dan kecepatan 2.5 m/s [2]. Akibat dari penambahan *ship unloader* maka akan bertambah pula kapasitas batubara yang akan disalurkan menuju *coal storage* sehingga akan berdampak pada penumpukan batubara pada *ship unloader* dan membutuhkan waktu yang lama untuk menyalurkan batubara menuju *coal storage*.

Untuk pengoptimalan waktu penyaluran batubara dari *ship unloader*, PLTU Paiton Unit 9 menambah sabuk konveyor jalur 1B – 2B. Oleh karena itu makalah ini bertujuan untuk menganalisis perhitungan penambahan belt konveyor 1B – 2B pada PLTU Paiton Unit 9.

Tujuan

1. Menjadi alat redudansi sabuk konveyor 1A – 2A yang telah terpasang di PLTU Paiton Unit 9.
2. Menganalisis perhitungan penambahan jalur sabuk konveyor 1B di PLTU Paiton Unit 9.
3. Menganalisis perhitungan penambahan jalur sabuk konveyor 2B di PLTU Paiton Unit 9.

II. METODE PENELITIAN

Gambar.1 Diagram Alir Metode Penelitian

1. Tinjauan Pustaka

Studi literatur dilakukan dengan cara membaca manual book, membaca gambar, membaca jurnal, membaca buku berkaitan dengan jalur konveyor dan mendapat referensi teori dari *Human Resources Development (HRD) PT. Rekadaya Elekrika*.

Perhitungan kapasitas, kecepatan sabuk, lebar sabuk, dan daya motor berdasarkan rekomendasi *manual Book Conveyor Equipment Manufacturers Association* [3].

a. Perhitungan Kapasitas

Perhitungan kapasitas yang diinginkan untuk belt konveyor menggunakan persamaan 1 :

$$Q_{100} = \frac{ft^3}{h} \times \frac{100 \text{ (fpm)}}{\text{actual belt speed (fpm)}} \quad [ft^3/h] \text{ [3]} \quad \dots\dots\dots [Persamaan.1]$$

Keterangan :

Q : Kapasitas yang diinginkan

$\frac{ft^3}{h}$: Kapasitas material yang diangkut

b. Perhitungan Lebar Sabuk

Perhitungan lebar sabuk menggunakan tabel 2 dengan melihat nilai kapasitas yang diinginkan (Q100) dan nilai *throughing idler belt*.

Tabel.2 Menentukan Lebar Belt dengan Q100 dan Throughing Belt

c. Perhitungan Kecepatan Sabuk

Perhitungan kecepatan belt ditentukan menggunakan Tabel 3 dengan melihat material yang diangkat oleh sabuk konveyor.

Tabel.3 Menentukan Kecepatan Belt

| Material Being Conveyed | Belt Speeds (fpm) | Belt Width (in) |
|--|--|-----------------|
| Grain or other free flowing, nonabrasive material | 400 | 18 |
| | 600 | 24-30 |
| | 800 | 36-42 |
| | 1000 | 48-96 |
| | 1200 | 108-120 |
| Coal, damp clay, soft ores, overburden and earth, fine crushed stone | 600 | 18 |
| | 800 | 24-36 |
| | 1000 | 42-60 |
| | 1200 | 72-96 |
| | 1400 | 108-120 |
| Heavy, hard, sharp edged ore, coarse crushed stone | 400 | 18 |
| | 600 | 24-36 |
| | 800 | 42-60 |
| | 1000 | 72-96 |
| | 1200 | 108-120 |
| Foundry sand, prepared or damp; shake-out sand with small cores, with or without small castings (not hot enough to harm belting) | 350 | Any Width |
| Prepared foundry sand and similar damp (or dry abrasive) materials discharged from belt by rubber edged plows | 200 | Any Width |
| Nonabrasive materials discharged from belt by means of plows | 200 Except for wood pulp where 300 to 400 is preferable | Any Width |
| Feeder belts, flat or troughed, for feeding fine, nonabrasive, or mildly abrasive materials from hoppers and bins | 50 to 100 | Any Width |
| Coal (bituminous, sub-bituminous), PRB coal, lignite, petroleum coke, gob, culm and silt. | 500 to 700 for belt conveyors 380 to 500 for silo feed conveyors and tripper belt conveyors | Any Width |
| Power Generating Plant applications | 500 for belt conveyors 380 for silo feed conveyors and tripper belt conveyors | Any Width |

d. Perhitungan Daya Motor (HP)

$$HP = Te \times v \quad [3][\text{Persamaan.2}]$$

Keterangan :

HP : daya motor (Watt)

Te : Efektifitas tension belt (kg)

v : kecepatan aktual belt (m/s)

III. HASIL DAN PEMBAHASAN

3.1 Data Parameter *Belt Conveyor*

Data parameter yang dibutuhkan dalam perhitungan kapasitas, lebar sabuk, kecepatan sabuk, dan daya sabuk pada jalur konveyor 1B – 2B PLTU Paiton Unit 9 yang telah sesuai dengan *manual book Conveyor Equipment Manufacturers Association*.

Kesimpulan hasil analisa perhitungan :

1. Berdasarkan Tabel 4 dan Tabel 5 (halaman 6 dan 7), spesifikasi konveyor 1B – 2B dapat menjadi alat redudansi (*back up*) pada jalur belt konveyor 1A – 2A di PLTU Paiton unit 9.
2. Nilai perhitungan kapasitas sabuk (1.500 ton/sekon), lebar sabuk (1400 mm), kecepatan sabuk(2,5 m/s) untuk sabuk konveyor 1B sesuai dengan rekomendasi spesifikasi belt konveyor jalur 1B di PLTU Paiton Unit 9.
3. Nilai perhitungan kapasitas sabuk (1500 ton/sekon), kecepatan sabuk(2,5 m/s), lebar sabuk 2B (1400 mm) sesuai dengan rekomendasi spesifikasi sabuk konveyor jalur 2B di PLTU Paiton Unit 9.
4. Daya sabuk konveyor 1B sesuai dengan rekomendasi spesifikasi belt konveyor jalur 2B di PLTU Paiton Unit 9 sebesar 50 kW.
5. Daya sabuk konveyor 2B sesuai dengan rekomendasi spesifikasi belt konveyor jalur 2B di PLTU Paiton Unit 9 sebesar 57, 30 kW.
